A Lesson in Psychology

AN OLD CHIEF of the Pueblo Indians, on his first visit to Chicago, was taken to the top of the new Tribune Tower Building. On leaving the elevator, he turned to his guide and asked, "When are we going up?" When he was told that he was already on the top floor, the old man declared flatly that he did not believe it, because he had climbed no ladders;—nor could he be persuaded until he looked over the city spread out beneath him.

It's all a matter of association. The Chief had always associated the idea of "going up" with the ladders of a Pueblo. In a similar fashion, to people in modern cities the world over, the idea of ascent is inextricably bound up with the name of Otis.

THE CHICAGO TRIBUNE BUILDING is equipped with nine (9) Otis Elevators, traveling at a speed of 800 F. P. M., and operating with signed control, which is entirely automatic in operation and independent of the operator. This is the newest and most improved operation for intensive elevator service in high buildings.

Cut Your Costs

Improve Your Product!

True economy, like true beauty, is more than skin deep!

For example, in the matter of factory fuel.

The kind that is cheapest to buy usually costs you most in the end.

But the advantages that go with gas make it the most economical fuel in the long run.

You will see why this is particularly true in your industry when you read our new book on gas as a factory fuel.

Write for your copy today—no charge.

Standardized Concrete

This illustration of the Koehring escapement type batch meter shows the method by which the discharge chute is automatically locked as soon as the charge enters the drum. The discharge chute cannot be moved until the regulated mixing time has elapsed, when it automatically releases the discharge lever and signals the fact with a bell. The meter also registers each batch that enters the drum.

Patent Nos. 1,321,460; 1,282,558; 1,338,761.

The Koehring Company long ago foresaw the value of standardizing concrete,—foresaw and provided for it before the tremendous volume used in constructing roads and permanent structures made standardized concrete a vital necessity.

One of the most important means of insuring a uniform strength and quality of concrete is the Koehring Batch Meter,—a positive means for timing each batch and measuring the thoroughness of mix. This device, upon being set for the specified mixing period, automatically locks the discharge chute as soon as the drum receives the materials; the discharge chute cannot then be operated until the full specified mixing time has elapsed.

Every state highway department requires, in its specifications for concrete highway construction, the use of batch meters. This Koehring development is an integral unit on practically every paving mixer today,—a Koehring contribution to the industry.

The Koehring mixer, with the Koehring batch meter, Koehring five action remixing principle, and the Koehring automatic water measuring tank, provides the most positive mechanical means yet developed for producing standardized concrete of unvarying uniformity.
