Conversations About Research Ethics

CARE
The CARE program is a year-long university-wide series of faculty-led conversations related to the ethical issues that arise from engaging in research. There is a need to explore not only the ethical importance of research at Ohio State University, but also the ethical problems that come up in the process of conducting research and the manner in which our university community members address these challenges across the disciplines. The panel discussions we host will create opportunities for researchers across the OSU campus to engage in a more comprehensive and critical reflection about the ethical ramifications of the way they conduct their research.
Research Ethics in Humanitarian Crises

Dr Veena Pillai

Empowering emerging and vulnerable populations through research, communication and training
Types of Humanitarian Crises

• Acute vs Protracted Humanitarian Crises

• Humanitarian situations outside “crisis”

• Survivors of emergency situations are vulnerable populations that need special protection from exploitation.

Evidence Based Practice in Humanitarian Crises

- Challenge of Guidelines in a dynamic, diverse field

- Paucity of evidence to guide response in disaster settings\(^1\)

- 1 percent of published disaster research articles are about Lower and Middle Income countries

- Of that 1 percent, 80% are authored by researchers from high resource countries\(^1\)

*Empowering emerging and vulnerable populations through research, communication and training*
Choosing a Research Question

• The question it itself should in some way benefit the victims of the crisis: The topic should be relevant and appropriate.

  • *Research should always be responsive to the needs of the victims of the emergency.*

  • *Only research that does not hinder or obstruct effective and appropriate interventions should be carried out.*

  • *Research should improve interventions and/or local capacity to respond to the current or future emergency.*

Empowering emerging and vulnerable populations through research, communication and training.
Methods

• Access

• Key persons and authorities

• Sampling

• Scientific Rigour

Empowering emerging and vulnerable populations through research, communication and training
Ethics Review Board

- Pre approval
- Exemptions
- Alternatives to ERB

Empowering emerging and vulnerable populations through research, communication and training
Respect for Persons

• Informed Consent

• Power Dynamic

• Trust/ Relationships

Empowering emerging and vulnerable populations through research, communication and training
Non Maleficence

- Triggers/Mental Health
- Possible consequences of results
- Exploitation
- Ensure relief efforts are not hampered

Empowering emerging and vulnerable populations through research, communication and training
Beneficence

“While the baseline of ‘do no harm’ is recognized as an important starting point, there is a growing sense that research into human suffering ought only to be justifiable if it contributes to the ending of that suffering⁴

• Must be appropriate for the study population
• Compensation vs incentive
• Implementation/interventional science (sustainability)
• Ensure scientific rigour
• Data dissemination strategy

Empowering emerging and vulnerable populations through research, communication and training
Justice

• Participant selection

• Community Leaders

• Beneficence

Recommendations for Researchers

- Start early and think of ethics from research question – data dissemination and impact of study
- Ensure basic needs of your study population are met before beginning
- Submit for ethics review early
- Collaborate with key persons from the community from the start
- Ensure key persons are representative of the community including the marginalized groups within the community
- Assess for an appropriate compensation
