Downloaded from the Knowledge Bank, The Ohio State University's institutional repository

This booklet is No. 72 in the Vocational and Professional Monograph Series issued by this company. The author, a member of the Astronomy Department of the University of Michigan, presents in a concise manner the facts which would be of interest to anyone considering the profession of astronomy. After a short introduction concerning its historical development, the status of modern astronomy is briefly discussed. The nature of the work of the modern astronomer is outlined, and the personal qualifications desirable in this profession are listed. The nature and the cost of training in the field are discussed in rather specific terms, and employment opportunities indicated.

This is the first of this series which has come to the attention of the reviewer, and if the other vocations and professions are treated as well as astronomy, these monographs should be available in all high school, college, and university libraries, to provide valuable guidance to our students.

Nicholas Mogendorff
