The Dellroy quadrangle, in west-central Carroll County, is the fourth in a series of geologic maps that will cover most of the county. The map identifies the Pennsylvanian bedrock formations and recent alluvial deposits and briefly considers the mineral resources of the area. Oil and gas have been produced from the Union Pool in the southeastern part of the quadrangle area, but the principal mineral resource is the Upper Freeport (No. 7) coal, which has been mined in the area for a century.

Residents of the area and visitors to Atwood Reservoir should find the map of interest. Mineral producers, developers, and planners will find it a welcome addition to the adjoining geologic maps already published for northern Carroll County.
