
Pest Management. *B. P. Beirne.* Leonard Hill Books, Grampian Press Ltd., Hammersmith, London. Available in the United States from Chemical Rubber Co., Cleveland, Ohio. 1967. 123 p. \$10.95.

The author re-defines and re-classifies the common categories of pest control, such as natural or environmental, chemical, biological, cultural, mechanical, and legislative, into a coordinated system to be known as "pest management." This is a newer term for what has been commonly called "integrated control" by many.

Topics by chapters are: Pests, Controls, Protection, Destruction, Practices, People, and Prospects. The proposed plan for pest management would be broader in scope and more costly than our present space program, but it may become necessary if our human "population explosion" continues. The book will make interesting reading for graduate students and professors in the area of population control or regulation. Unfortunately there are no literature citations.
