
Glacial Map of Licking County, Ohio. *Jane L. Forsyth.* Colored map, 1 sheet, scale 1 inch equals 1 mile. State of Ohio, Department of Natural Resources, Division of Geological Survey, 1207 Grandview Avenue, Columbus, Ohio 43212. 1966. \$1.13 folded.

Glacial deposits of both Wisconsin and Illinoian age are shown in color on a topographic map base and the location of gravel pits is indicated. Dr. Forsyth gives a description of the various glacial deposits. Mineral resources related to the glacial deposits are sand and gravel, ground water, peat, and soil.

Contours drawn on the buried bedrock surface are also included on this map. Though much of the area, especially in the eastern half of the county, has bedrock at or near the surface, a deeply buried drainage system, occurring at depths of as much as 600 feet, is also present.

This map will be of interest to sand and gravel operators, farmers, well drillers, geologists, and others concerned with Licking County.
