
Textbook of Zoology

The largest difference between this edition and the previous one is the addition of a chapter on ecology; the remainder of the book is essentially the same brought up-to-date. The new chapter is that sort of ecology which is largely a recitation and classification of relationships between animals and their environments. The factors operating to bring about these circumstances receive little attention. It would seem that selection of essential information from the chapters Interpreting Animals, Interpreting Plants, and Ecology, and its arrangement into an orderly system would have produced a section of greater merit. The tinted paper, new type, and colorful binding make a very attractive book.—*Carl Venard.*

Animal Biology, by Michael F. Guyer. xix + 723 pp. 423 figs. 3rd ed. New York, Harper and Brothers. 1941. \$3.75.
