

**AN ADDITION TO THE ODONATA OF OHIO.**

REES PHILPOTT.

The list of dragonflies of Ohio given by Professor Kellicott contained 98 species actually collected, and mentioned one, *Anax longipes* Hagen, as having been recognized on the wing in June, 1898, by Chas. Dury, of Cincinnati.

Records for this species might lead one to believe that it is partial to coast regions. Hagen and Calvert record it from Massachusetts, New York, New Jersey, Maryland, Georgia, Florida, Mexico, West Indies and Brazil. It is a fact, however, that it has never been reported as common in any region.

This past summer the author had the good fortune to capture a male of *Anax longipes* on the wing while at the Lake Laboratory, at Cedar Point, Sandusky, Ohio. The specimen was taken July 25th, 1913, about half a mile south of the laboratory, midway between Lake Erie and Sandusky Bay, near a small pool of stagnant water. This capture extends the known distribution of the species westward and suggests the possibility of its presence over a much wider range than actual records would indicate.
