

POTAMOGETON VASEYI IN NORTHEASTERN OHIO.

O. E. JENNINGS.

Potamogeton Vaseyi Robbins is an interesting little water plant which deserves to be listed among the other rare or noteworthy plants occurring in the northeastern part of Ohio. Prof. L. S. Hopkins, Kent Normal School, collected this species at Brady's Lake, Portage County, June 22, 1913, the plant then being in flower. This last year Mr. John Bright, Glenshaw, Pa., collected it with the spikes bearing partly mature achenes on July 28, 1918, at the mouth of Cowles Creek, near Geneva-on-the-Lake, Ashtabula County.

The range of the species is reported as "Quebec to Wisconsin, south to southern New York" (Britton and Brown. Ill. Flora, 1 : 83. 1913), or Maine to Ontario, south to Connecticut, New York, Ohio, Illinois, and Minnesota, local (Gray's New Manual of Botany. 1908). The species is not known to occur in northwestern Pennsylvania, although it occurs in the Scranton district, in the northeastern part of that state. (Flora of Northeastern Pennsylvania. Alfred Twining. 1917).

Two other pond-weeds were collected from Cowles Creek by Mr. Bright: *Potamogeton foliosus* Raf., and *P. americana* Cham. & Schl.
